

The Promise Machine, explained properly

The law, the specialist skills, the working disciplines, and the delivery system that puts them together.

ONE LAW. SPECIALIST TOOLS. VISIBLE DELIVERY.

Fiat is the controller, not the magic trick.

Four parts. Different jobs.

If these four ideas stay separate, the rest of the framework stops looking like an incantation.

01

Promise Machine

The shared law. Every claim names its evidence, its boundary, the action it permits, and what happens when the evidence fails.

02

Domain skills

The specialists. Each handles one subject or artefact: historic state, credit records, hook effects, gas, citations, or another narrow job.

03

Phase skills

The disciplines. They travel between jobs: specify first, guard boundaries, make operations visible, measure speed, fix causes, and record decisions.

04

Hexaameron + Fiat

The delivery system and its controller. Hex selects the tools a job needs. Fiat moves the run one evidenced step at a time.

THE MODEL DOES THE WORK. THE CONTROLLER DECIDES WHAT COMES NEXT.

One law. Two shelves. One delivery line.

Hex chooses what the job needs. It does not empty the entire workshop onto every task.

What the Promise Machine actually does

No skill may claim more than its evidence establishes, or authorise a more consequential transition than that evidence warrants.

The contract governs claims and next actions. It does not make sources true or models infallible.

Evidence has a type

Checked, measured, recorded, attested, proved, inferred, and unknown describe different relationships. They are not medals from weak to strong.

01 Promise

State the narrow claim.

02 Evidence

Name the record, check, measurement, proof, or source.

03 Boundary

Name the tempting conclusion the evidence does not support.

04 Authorised action

Permit only the action the evidence warrants.

05 Refusal + recovery

Block the dependent action; keep inspection, repair, and safe exit.

FAILURE BLOCKS THE NEXT DEPENDENT ACTION - NOT DIAGNOSIS, ROLLBACK, REPAYMENT, OR CURE.

When skills compose, the hand-off keeps the subject, scope, evidence class, time boundary, and unresolved gaps.

Evidence first. Action second. Recovery stays open.

A failed check takes the safe route. It does not pretend the missing evidence exists.

Domain skills answer narrow questions

Most run by themselves. Hex selects them only when a delivery needs their result.

Prepare sources

HOROS / LEMMA

HOROS draws a reading boundary around a repository. LEMMA turns Solidity or Markdown sources into validated, source-linked chunks.

Preserve evidence

ALEXANDRIA / LAZARUS / TABULARIUM

ALEXANDRIA preserves lending captures by digest. LAZARUS captures finite historic Ethereum state. TABULARIUM rebuilds venue-qualified credit events.

Ground decisions

PROBITAS / BEREAN / ARIADNE

PROBITAS builds an address-scoped lending dossier. BEREAN binds answers to pinned sources and evaluations. ARIADNE binds an artefact digest to its evidence statement.

Check behaviour and communication

PANDECTS / JANUS / HERMES / BREVITAS / SAPHENEIA

PANDECTS supplies executable credit laws. JANUS checks hook effects. HERMES measures Solidity gas work. BREVITAS protects evidence in prose. SAPHENEIA shapes AuDHD-readable interaction.

A specialist owns its promise. Hexaemeron is a customer of that work, not its source of truth.

Six phase skills travel between jobs

They apply when the step incurs their question. This is selection, not ceremony.

Protasis

STUDY + RUNBOOK

Have we stated the problem, assumptions, trade, risks, and checkable finish before building?

Phylax

IMPLEMENTATION

What outside data, command, URL, secret, dependency, or model output crosses a boundary, and what guards it?

Ephoros

UNATTENDED WORK

What will somebody ask at 3 a.m., and which events, metrics, traces, or alerts answer it?

Metron

PERFORMANCE ONLY

Did the same measurement improve beyond the noise while correctness stayed green?

Elenchus

OBSERVED FAILURES

Can we reproduce the failure, fix its mechanism, and leave a test that fails without the fix?

Hypomnema

DURABLE RECORDS

Which decision must outlive its author, and where will the next person find the reason?

No baseline means no performance change. No observed failure means no Elenchus diagnosis.

Hexaameron organises the run

Fiat controls the next step. The model does the work; the controller orders and records it.

Hexaameron

The production system: study, runbook, implementation, audit, prose, push, and one final integration.

Fiat

The explicit entry skill and controller. It emits one directive, checks the receipt, records state, then decides what comes next.

The truth boundary

The ledger proves receipt order and shape. It does not prove the test summary, audit judgement, or implementation claim inside a receipt.

THE RUN

Reviewable branch stack

Each step targets the step below it. Nothing lands on the base during the run. The finished stack reaches the base through one integration.

What ships inside Hex

Protasis and the five other phase skills; Imprimatur and Vulgate for prose; X-Ray, Solidity Auditor, and Fizz for Solidity review; Kronos as an optional frontier loop.

Visible steps. Recorded evidence. One final delivery.

Conversation is not the source of truth. Durable state and the hash-chained ledger are.

How Hex chooses what to use

Four questions decide the toolset. Nothing runs merely because it exists.

01 What is the job about?

The subject selects domain skills: Lazarus for historic state, Janus for a hook boundary, Probitas for a lending dossier.

02 What does this step introduce?

The behaviour selects phase skills: a URL fetch invokes Phylax; an unattended worker invokes Ephoros; a speed claim invokes Metron.

03 What is being shipped?

Solidity invokes the security suite. Shipped prose invokes Hypomnema, Imprimatur, and Vulgate. Repository changes invoke signed review and integration.

04 What evidence exists now?

No failure means no Elenchus diagnosis. No baseline means no performance edit. Missing evidence blocks only the dependent action.

WHEN FIAT STAYS IN THE CUPBOARD

Small job? Use the skill.

A launch post that sounds machine-written needs Imprimatur and Vulgate. It does not need a repository delivery, branch stack, or controller ledger.

CONSISTENCY != CEREMONY

A source-grounded credit agent

Topic: answer questions about historic lending activity, with citations a reviewer can check.

DOMAIN SELECTION

The evidence path

Alexandria preserve lending captures

Tabularium rebuild qualified credit events

Probitas assemble the address-scoped dossier

Lemma prepare source-linked document chunks

Berean bind answers to sources and evaluations

Ariadne bind the release digest to its evidence

PHASE SELECTION

Only where the step incurs it

Phylax guards RPC, fetch, path, credential, and model boundaries

Ephoros applies if harvesting or answering runs unattended

Metron applies only when the study sets a time budget

Elenchus starts only when a test, build, or evaluation fails

Hypomnema records expensive schema and evidence decisions

A MATCHED CITATION PROVES THE SOURCE BYTES MATCH. IT DOES NOT PROVE THE SOURCE SENTENCE TRUE.

Receipts, refusals, and what 'done' means

Receipt

Durable evidence that a named phase crossed its required boundary, in order. It may name an artefact, commit, check, audit round, pull request, or merge.

Refusal

A missing or failed check blocks the dependent next action. The stop is recorded. Inspection, repair, rerun, rollback, and safe exit remain available.

Done

The delivery reached the named base through the recorded process and its required gates accepted their subjects. It does not mean perfect or infallible.

NAMING WITHOUT THE ASYLUM

PROMISE MACHINE

shared law

SKILL

bounded working method

DOMAIN SKILL

subject specialist

PHASE SKILL

travelling discipline

HEXAEMERON / HEX

delivery system

FIAT

controller

KRONOS

optional outer loop

GATE

check before action

FRONTIER

next evidenced improvement

NOT ONE MADNESS BOX: NARROW TOOLS, ONE LAW, AND A DELIVERY SYSTEM WHEN THE JOB NEEDS IT.
